

# Intro to Python & Programming

C-START Python PD Workshop

*Don't just buy a new video game, make one.*

*Don't just download the latest app, help design it.*

*Don't just play on your phone, program it.*

*No one is born a computer scientist, but with a little hard work and some math and science, just about anyone can become one.*

— Barack Obama

## Before We Start: A Note on Copy-Paste

When small code examples are shown on the slides, it's probably better for you to type in the code examples yourself than try to copy-paste them. You'll learn more by doing so!

Larger code examples are provided on the website rather than in the slides.

Not to mention, some PDF viewers throw crazy characters at you when you try and copy-paste; Python won't like this!

## Review: Variables

In math, when we write =, we mean **relation**:

$$x^3 - x + 1 = 0$$

## Review: Variables

In math, when we write  $=$ , we mean **relation**:

$$x^3 - x + 1 = 0$$

This is **not** the same in programming! In most programming languages, including Python,  $=$  means **assignment**. We let the *variable on the left* take the *value on the right*.

```
x = 10
y = x + 2
x = 11
print(x, y)
```

## Review: Variables

In math, when we write =, we mean **relation**:

$$x^3 - x + 1 = 0$$

This is **not** the same in programming! In most programming languages, including Python, = means **assignment**. We let the *variable on the left* take the *value on the right*.

```
x = 10
y = x + 2
x = 11
print(x, y)
```

---

```
11 12
```

## Review: Accepting User Input

The `input` function takes a prompt string, and returns the string the user types.

```
name = input("What is your name? ")  
print("Nice to meet you", name)
```

# Review: Operators

Python provides a simple notation to write mathematical statements.

+	Addition
-	Subtraction
*	Multiplicaton
**	Exponentation
/	Division
//	Integer Division
%	Modulus (division remainder)

# Operators Example in Python REPL

```
>>> (4 + 3) * 6
```

```
42
```

```
>>> 4 ** 3
```

```
64
```

```
>>> 33 / 2
```

```
16.5
```

```
>>> 33 // 2
```

```
16
```

```
>>> 74 % 8
```

```
2
```

## Notice the Notation

The `>>>` symbol is used to indicate lines typed at the interactive interpreter (“Python Shell” in IDLE). No need to type `>>>` yourself.

**Comments** are a way for programmers to leave notes for others (and sometimes even themselves) in their code. In Python, you can write comments using the # symbol. Anything from # to the end of line will be ignored in Python.

```
# This defines x to the value 10  
x = 10  
x = x + 1    # add one to x
```

# Comments

**Comments** are a way for programmers to leave notes for others (and sometimes even themselves) in their code. In Python, you can write comments using the # symbol. Anything from # to the end of line will be ignored in Python.

```
# This defines x to the value 10  
x = 10  
x = x + 1    # add one to x
```

## When should I leave comments in my code?

Python ignores comments, so you never *have* to leave comments in your source. However, if you feel that a piece of code needs explanation for other Python programmers to understand it, usually it's a good idea to leave a comment.

# The len Function

The `len` function takes a sequence (such as a string) and returns its length. For example:

```
>>> len("Jack")
4
>>> len("Hello World!")
12
```

Kattis is a website that can automatically check your solution to problems. You may optionally use Kattis in this workshop for mini-projects. Kattis could be used in K-12 classrooms.

- 1 Click *Hello World!* Kattis problem from workshop website
- 2 Create an account on Kattis
- 3 Upload a solution to *Hello World!*
- 4 Make sure it got accepted!

**10 Kinds of People**

The world is made up of 10 kinds of people, those who understand binary and those who do not. These different kinds of people do not always get along so well. Bob might ask for a 10000 ounce coffee (meaning binary) and Alice might make misinterpret his request as being in decimal and give him a 10011100010000 ounce coffee (binary). After Sue explains that this much coffee costs 100 dollars (decimal), Bob might assume he only has to pay 4 dollars (interpreting the price as being in binary). In response to these differences that are difficult to resolve, these two groups have divided the world into two regions, the binary-friendly zones and the decimal-friendly zones. They have even published a map like the following to help people keep up with where the areas are (they have used ones and zeros so nobody would have trouble reading it).

```
1111000000
1111000000
1110000011
0111100111
0011111111
```

Users of binary have to stay in the zones marked with a zero. Users of decimal have to stay in the zones marked

# Input & Output on Kattis

Input on Kattis corresponds to the `input` function, and output corresponds to the `print` function.

- Kattis is pretty lenient on whitespace, so you should be OK adding extra spaces where needed.
- Kattis considers any prompt you use on the `input` function to be output, and this will confuse her. So, to get a line of input, use no prompt at all:

```
line = input()
```

- Remember `input` returns a string, so you will need to convert it to an integer if you need it as one.

```
N = int(input())
```
